Основные навыки

Amazon Web Services (AWS)

NestJS

SaaS Development

Gurgen Varzhapetyan

Software Engineer | Full-Stack | TypeScript • React • Next.js • NestJS • PostgreSQL • AWS | AI-Assisted Development

Гюмри, Ширакская область, Армения

Общие сведения

Full-Stack Software Engineer focused on building production web applications, B2B SaaS platforms, APIs, and complex business systems.I started primarily with frontend development and gradually expanded into full-stack engineering, taking responsibility for backend architecture, database design, business logic, integrations, authentication systems, and production infrastructure. What I work onMy main stack includes TypeScript, React, Next.js, Node.js, NestJS, PostgreSQL, Redis, Docker, and AWS.I have worked on projects ranging from public-facing platforms and data collection systems to large B2B SaaS applications used by real businesses and users.My experience includes:• Full-stack web application development• Backend architecture and REST API development• PostgreSQL database design and structuring• Multi-tenant B2B SaaS systems• Authentication, authorization, sessions, roles and permissions• Dynamic website builders and reusable component systems• Third-party API integrations• Web scraping and automated data collection• Docker and AWS infrastructure• Production debugging, optimization and maintenance# Product & architecture experienceI have worked on large systems where the challenge is not simply implementing individual features, but designing business logic and architecture that remain maintainable as the product grows.This includes building backend systems, structuring databases, implementing multi-tenant logic, integrating external services, and developing dynamic website-generation systems based on reusable components and templates. AI-assisted developmentI actively use modern AI development tools, including OpenAI Codex and Cursor, as part of my engineering workflow.I use AI to accelerate technical research, implementation, debugging, refactoring, documentation, code analysis, and repetitive tasks while keeping architecture, security, code quality, testing, and final engineering decisions under manual control.## Core technologiesTypeScript • JavaScript • React • Next.js • Node.js • NestJS • PostgreSQL • Prisma • TypeORM • Redis • REST

APIs • Docker • AWS • Git I’m interested in international software engineering opportunities, including remote positions and teams working across different countries and time zones.

Опыт работы

Brain Fors
Software Engineer
июля 2022 - Present (4 года 4 месяца)
Гюмри, Ширакская область, Армения

• Contributed to Upstart.am across both frontend and backend development, starting with frontend implementation and later building backend functionality for tickets, bilingual courses, and QR-code-based workflows.

• Built multiple web scraping and data collection scripts to extract structured data from third-party websites, including sites protected by anti-bot mechanisms and CAPTCHA challenges.

• Worked extensively on AestheticHubPro.com, a large B2B SaaS platform, with major responsibility for backend development, database architecture, business logic, and system structure on AWS platform.

• Designed and developed the website-builder module for AestheticHubPro, working across both frontend and backend. The builder supports dynamically generated websites using reusable predefined components, configurable content, and multiple templates.

• Developed the frontend of globalitaeards.am, implementing the website interface and application functionality based on project requirements.

• Contributed to multiple internal production-grade projects that are actively used by businesses and end users, working with real-world requirements, evolving business logic, integrations, and production constraints.

• Expanded from primarily frontend development into full-stack engineering, working with React, Next.js, TypeScript, Node.js, NestJS, PostgreSQL, databases, APIs, authentication, business logic, and application architecture.

• Integrated AI-assisted development into daily engineering workflows using tools such as OpenAI Codex and Cursor to accelerate implementation, debugging, refactoring, research, and repetitive development tasks while retaining manual review and architectural control.
